                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                 New immunoglobulin molecules are described that bind kinase insert domain-confeaining receptor (KDR) with a comparable affinity to human vascular endothelial growth factor (VEGF). The antibodies neutralise KDR activacion. The immunoglobulin may be a multivalent single chain antibody, a monovalent single chain antibody, a diabody, a chimarised antibody, a diabody, a crimabody, a humanised antibody a chimarised antibody. The immunoglobulin molecules bind specifically to an extracellular domain of the KDR receptor with the same affinity as carracellular domain of the KDR receptor with the same affinity as them number cell lines including glioblastoma multiforme, human tumour cell lines including glioblastoma multiforme, human tumour cell lines including glioblastoma and AIDS associated karposi's sarcoma. The antibodies therefore have applications in treating these conditions. This sequence encodes a conference of immunoglobulins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vasculas endothelial growth factor receptor; VEGFR; antagonist; tumour; cytostafelc, light chain hypervariable region; VL; myelocytic leukaemia; lymphocytic; erythrocytic; monocytic; moliphe monocytic; moliphe myeloma; lymphod cell; Hodgkings disease; complementarity determining region-3; CDR-3; mouse.
                                             Novel immunoglobulin molecules binding kinase insert domain-containing receptor with the same affinity as vascular endothelial growth factor, used to reguce tumour growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting growth of non-solid tumor cells useful to treat bone marrow

The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGFR) in mammals particularly humans. The method involves treating the mammals with humanised VEGFR monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse variable region joined to human constant region, where the humanised mouse variable region orntains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating leakemias such as acute or chronic myelocytic leukaemia, extraoric lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to non-Hodgkin's and Hodgkin's disease. The present sequence is humanised antibody murine light chalm hypervariable region (VL) CDR-3 used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present sequence is that of complementarity determining region (see also AAB82702) of IMC-1C11, a mouse-human chimeric antibody that has vascular endothelial growth factor (VEGF) antagonist activity. The antibody, or a fragment of it, can be used as an anti-anglogenic molecule, together with a chemotherapeutic acid, for the treatment of an anglogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an anglogenic dependent condition by administering an anti-anglogenic molecule and a chemotherapeutic agent. The preventing significant toxicity of the chemotherapeutic agent. The anti-anglogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-1C11. Conditions that can be treated include a neoplasm, a collagent wascular disease or an autoimmune disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of immunoglobulin (Ig) site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting angiogenesis; reducing endothelial cell proliferation; inhibiting vEGF induced migration of human leukasemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in the desired configuration. (I) is bivalent and bispecific, homogeneous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides
This antibody binds to human sialoadhesin factor-2 (SAF-2). The antibody is useful for treating or preventing allergic rhinitis, allergies, asthma, anemia, eccema or diseases such as lymphoma, leukemia or systemic mastocytosis in a mammal. It is also useful for detecting the presence of a cell, especially eosinophil in a sample, by detecting binding of the antibody to SAF-2. The antibody can be coupled to toxins, antiproliferative drugs or radionuclides to kill cells in areas of excessive SAF-2 expression.
                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  anglogenesis inhibitor; vascular endothelial growth factor receptor; VEGF; tumour; leukaemia; antibody; cell proliferation inhibitor; antibody light chain variable domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Complementarity determining region; CDR; CDRL3; antigen; cytostatic;

ó
and in tetrameric form. The heavy chain constant domains which constitute the Fc region (e.g., CH2 and CH3 for an IgG molecule) of a natural antibody and which provide other antibody functions can be present. There is no requirement for processing in virro to obtain the complete product. This peptide sequence represents the light chain variable domain complementarity determining region L3 (CDRL3) incorporated into an antigen-binding protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                              cytostatic; light chain; myelocytic leukaemia; lymphocytic; erythrocytic; monocytic; multiple myeloma; lymphoid cell; Hodgkin's disease; mouse;

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which care stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) in the complex of the Culture of immunoglobulin (Ig) is useful for: cartiforth to the N terminus of the CH1 domain. (I) is useful for: cartiforth to the N terminus of the CH1 domain. (I) is useful for: cartiforth to the N terminus of the CH1 domain. (I) is useful for: cartiforth to activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting vEGF induced migration of human leukaemia cells; blocking interaction of a protein and intransity and invitro for investigative, diagnostic or treatment cand in vivo and in vitro for investigative, diagnostic or treatment cand in vitro for investigative, diagnostic or treatment complexed configuration. (I) is bivalent and bispecific, homogeneous on the testime of configuration. (I) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute the FC region (e.g., CH2 and CH3 for an IgG molecule) of a natural cantibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. This sequence represents a light chain variable domain (will incorporated in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides .
                                                                                                                                                                                                            Antigen-binding protein; antibody light chain variable domain; cytostatic; angiogenesis inhibitor; tumour; leukaemia; antibody; vascular endothelial growth factor receptor; VEGF; cell proliferation inhibitor.
                                                                                                                                                                      Antigen-binding protein light chain variable domain (VH) #2.

The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGFR) in mammals particularly humans. The method involves treating the mammals with humanised VEGFR monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse (variable region foined to human constant region, where the humanised mouse action for human constant region, where the humanised mouse ariable region forman variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, acute or chionic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to non-Hoddkin's and Hodgkin's disease. The present sequence is humanised antibody light chain fragment used in the exemplification of the

invention.

New immunoglobulin molecules are described that bind kinase insert domain-containing receptor (KDR) with a comparable affinity to human execular endothelial growth factor (VEGF). The antibodies neutralise CRB activation. The immunoglobulin may be a multivalent single chain antibody, a monovalent single chain antibody, a diabody, a climerised antibody, a diabody, a crimerised antibody, a diabody, a crimerised antibody. The immunoglobulin molecules bind specifically to an extracellular domain of the KDR receptor with the same affinity as CREF. Overexpression of VEGF has been implicated in a number of human tumour cell lines including glioblastoma multiforme, human tumour cell lines including glioblastoma multiforme, cassociated Karposi's sarcoma. The antibodies therefore have applications in treating these conditions. This sequence encodes a preferred heavy chain complementary determining region of the immunoglobulins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel immunoglobulin molecules binding kinase insert domain-containing receptor with the same affinity as vascular endothelial growth factor, used to reduce tumour growth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents the light chain variable region of murine monoclonal antibody 2C4. This antibody binds to human sialoadhesin factor-2 (SAF-2). The antibody is useful for treating or preventing allergic rhinitis, allergies, asthma, anemia, eczema or diseases such as lymphoma, leukemia or systemic mastocytosis in a mammal. It is also useful for detecting the presence of a cell, especially eosinophil in a sample, by detecting the presence of a cell, especially eosinophil in can be coupled to toxins, antiproliferative drugs or radionuclides to kill cells in areas of excessive SAF-2 expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Monoclonal antibody 2C4; sialoadhesin factor-2; SAF-2; allergic rhinitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel monoclonal antibody specific for human sialoadhesin factor-2 for diagnosis, prevention, treatment of allergy, asthma, eczema or diseases such as lymphoma, leukemia or systemic mastocytosis, in a mammal

preventing significant toxicity of the chemotherapeutic agent. The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially INC-1C11. Conditions that can be treated include a neoplasm, a collagen vascular disease or an autoimmune disease, especially a solid tumour, including breast carcinoma, lung The antibody, The présent sequence is that of the light chain variable region of IMC-1CI, a mouse-human chimeric antibody that has vascular endothélial growth factor (VECF) antagonist activity. The antibody or a fragment of it, can be used as an anti-angiogenic molecule, together with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an anti-angiogenic molecule and a chemotherapeutic agent, to produce a regression or arrest of the condition while minimising or carcinoma, prostate carcinoma, colon carcinoma, prostate carcinoma, ovarián carcinoma, neuroblastoma, central nervous system tumour, neuroblastoma, glioblastoma multiforme or melanoma (all claimed). The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting vEGF induced ingration of human leutance cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment the design of (I) provides for efficient productions of that substantially all of the antigen-binding proteins produced are assembled in the design of (I) provides for efficient productions of the region (e.g., CH2 and CH3 for an IgG molecule) of a natural cand in vivo much down which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. This sequence represents a light chain variable domain (YH) incorporated into FV, an engineered protein containing a heavy chain variable domain and a light chain variable domain in one polypeptide chain, described in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method for inhibiting the growth of non-solid unmour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGFR) in mammals particularly humans. The method involves treating the mammals with humanised VEGFR monoclonal antibodies (artagonists). Humanised monoclonal antibody comprises humanised mouse variable region joined to human constant region, where the humanised mouse variable region contains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, acute or chronic Iymphocytic leukaemia, expthrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to
                                                                                                                                                                                                                                                                               Vascular endothelial growth factor receptor; VEGFR; antagonist; tumour; cytostatic; light chain; myelocytic leukaemia; lymphocytic; erythrocytic; monocytic; multiple myeloma; lymphoid cell; Hodgkin's disease; chimeric;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inhibiting growth of non-solid tumor cells useful to treat bone marrow tumors such as leukemias or multiple myeloma comprises treatment with an antagonist of a vascular endothelial growth factor receptor -

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (Pl) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) [1] is useful for: Ingit chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEF) receptor; reducing tumour growth; inhibiting angiogenesis; reducing endothelial cell proliferation; inhibiting vEGF induced ingration of human leutwaemla cells; blocking interaction of a protein and in vivo and in vitro for investigative, diagnostic or treatment and notice of investigative, diagnostic or treatment substantially all of the antigen-binding produced are assembled in the desired configuration. (I) is bivalent and bispecific, homogeneous the Fc region (e.g., CH2 and CH3 for an IgG molecule) of a natural antibody and which provide other antibody functions can be present. There is the antipon and in vitro to obtain the complete product. This is the annotation contain variable fragment.
                                                                                                                                                                                   New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antigen-binding protein; single chain variable fragment; scFv; antigen; cytostatic; angiogenesis inhibitor; tumour; leukaemia; antibody; vascular endothelial growth factor receptor; VEGF; cell proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (scFv), an engineered protein containing a variable light and variable heavy domain on one polypeptide, described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antigen-binding protein, single chain variable fragment version #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /label= VH

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antigen bid and protein; single chain variable fragment; svFv; antigen; cytostatic; anglogenesis inhibitor; tumour; leukaemia; antibody; vascular, endothelial growth factor receptor; VEGF; cell proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /label- Linker
/note= "15 amino acid linker joins the VH and VL
regions of the single chain variable fragment
protein. Encoded by AAS20285"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                        preventing significant toxicity of the chemotherapeutic agent. The anti-angiogenic molecule inhibits or blocks the action of a vascular anotherlum survival factor such as VEGF or its receptor, and is especially IMC-101. Conditions that can be treated include a neoplasm, a collagen-vascular disease or an autoimmune disease, especially a solid tumour, including breast carcinoma, lung carcinoma, prostate carcinoma, cancinoma, prostate carcinoma, carcinoma, neuroblastoma, central nervous system tumour, neuroblastem or melanoma (all claimed).
                                                                                                                The antibody,
                                                         The present sequence is that of the light chain variable region of IMC-ICII, a mouse-human chimeric antibody that has vascular endothelial growth factor (VECF) antagonist activity. The antibody or a fragment of it, can be used as an anti-angiogenic molecule, together with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an anti-angiogenic molecule and a chemotherapeutic agent, to produce a regression or arrest of the condition while minimising or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antigen binding protein, single chain variable fragment version #2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /label - VL

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) antigen-binding site located to the N terminus of immunoglobulin (Ig) cost can constant domain (CL domain), and P2 has an antigen-binding cost is located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting angiogenesis.

CC reducing endothelial cell proliferation; inhibiting vEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment completentially all of the antigen-binding proteins production so that substantially all of the antigen-binding proteins production so that the desired configuration. (I) is bivalent and bispecific, homogeneous of an in tetrameric form. The heavy chain constant domains which constitute the Fc region (e.g., CH2 and CH3 for an Ig6 molecule) of a natural configuration equipment for processing in vitro to obtain the complete product. This is the amino acid sequence of a single chain variable fragment configuration containing a variable light and variable warnable in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New bispecific immunoglobulin-like antigen-binding protein for reducing tunnour growth and for inhibiting anglogenesis, comprises a complex of two polypeptides and two second polypeptides  . \\

                                                                                                         The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGER) in mammals particularly humans. The method involves treating the mammals with humanised VEGER monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse variable region joined to human constant region, where the humanised mouse variable region contains mouse complementarity determining region (CDR) grafied into human variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, acute or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to non-Hodgkin's and Hodgkin's disease. The present sequence is humanised annibody heavy chain frgament used in the exemplification of the
               non-solid tumor cells useful to treat bone marrow
                             tumors such as leukemias or multiple myeloma comprises treatment with
an antagonist of a vascular endothelial growth factor receptor -
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9

The present sequence is that of the heavy chain variable region of IMC-ICI1, a mouse-human chimeric antibody that has vascular endothelial growth factor (VEGF) antagonist activity. The antibody, or a fragment of it, can be used as an anti-anglogenic molecule, together with a chemotherapeutic acid, for the treatment of an anglogenic dependent condition in a mammal, especially a human.

The invention relates generally to a method of treating or controlling an anglogenic dependent condition by administering an anti-anglogenic molecule and a chemotherapeutic agent, to produce a regression or arrest of the condition while minimising or preventing significant toxicity of the chemotherapeutic agent.

The anti-anglogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-ICI1. Conditions that can be treated include a neoplasm, a collageneral disease, an aneoplasm, a collageneral disease or an autoimmune disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Op
                                                                                                                                                                                                                                                                                                           The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which care stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) antigen-binding site located to the N terminus of immunoglobulin (Ig) (Stel located to the N terminus of the CH1 domain. (I) is useful for: contralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting angiogenesis; constrain of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions; inhibiting VEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment continuing proteins production so that the desired configuration. (I) is bivalent and bispecific, homogeneous or in the desired configuration. (I) is bivalent and bispecific, homogeneous or in the desired configuration. (I) is bivalent and bispecific, homogeneous can in tetrament form. The heavy chain constant domains which constitute the region (e.g., CH2 and CH3 for an IgG molecule) of a natural continuing and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. This sequence represents a heavy chain variable domain (VH) incorporated into the mathem of the invention of a plant variable domain in one polypeptide chain, described in the mathematic form of the contraction of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                               New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          IMC-1C11; chimeric antibody; mouse; human; antagonist; VEGF; vascular endothelial growth factor; angiogenesis; antiangiogenic; antitumour; neoplasm; collagen-vascular disease; autoimmune disease; tumour; breast carcinoma; lung carcinoma; prostate carcinoma; colon carcinoma; ovarian carcinoma; neuroblastoma;

The present sequence is that of the heavy chain variable region of IMC-ICI1, a mouse-human chimeric antibody that has vascular endothelial growth factor (VEGF) antagonist activity. The antibody, or a fragment of it, can be used as an anti-anglogenic molecule, copether with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an anglogenic dependent condition by administering an anti-anglogenic molecule and a chemotherapeutic agent, to produce a regression or arrest of the condition while minimising or preventing significant toxicity of the chemotherapeutic agent.

The anti-anglogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-ICII. Conditions that can be treated include

                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes an antigen-binding protein (1) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (1g) light chain constant domain (CL Gomain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (1) is useful for: neutrifilising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting anglogenesis; reducing endothelial cell proliferation; inhibiting veGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (1) provides for efficient production so that substignitally all of the antigen-binding proteins produced are assembled
                                                                                                                                                                                                                                                                           Antigen-binding protein; single chain variable fragment; svFv; antigen; cytostatig; anglogenesis inhibitor; tumour; leukaemia; antibody; vascular endothelial growth factor receptor; VEGF; cell proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting anglogenesis, comprises a complex of two polypeptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /label= Linker
/note= "15 amino acid linker joins the VH and VL
regions of the single chain variable fragment
protein. Encoded by AAS20285"
                                     Antigen-binding protein, single chain variable fragment version #2

                      and in tetrameric form. The heavy chain constant domains which constitute the Fc region (e.g., CH2 and CH3 for an IgG molecule) of a natural antibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. This is the amino acid sequence of a single chain variable fragment (scFv), an engineered protein containing a variable light and variable heavy domain on one polypeptide, described in the method of the
In the desired configuration. (I) is bivalent and bispecific, homogeneous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel immunoglobulin molecules binding kinase insert domain-containing receptor with the same affinity as vascular endothelial growth factor, used to reduce tumour growth

                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting anglogenesis; reducing endothelial cell proliferation; inhibiting VEGF induced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides

                                                                                                                                                                                                                                                                                     The immunoglobulin molecules bind specifically to an extracellular domain of the KDR receptor with the same affinity a VEGF. Overexpression of VEGF has been implicated in a number of human tumour cell lines including glioblastoma multiforme, hemangioblastoma, central nervous system neoplasms and AIDS associated Karposi's sarcoma. The antibodies therefore have applications in treating these conditions. This sequence encodes preferred heavy chain complementary determining region of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antigen-binding protein; antibody heavy chain variable domain; cytostatic, anglogenesis inhibitor; tumour; leukaemia; antibody; vascular endothelial growth factor receptor; VEGF; cell proliferation inhibitor.

                       its ligand; promoting interactions between immune cells and target cells, and in vivo and in vitro for investigative, diagnostic or treatment methods: The design of (1) provides for efficient production so that substantially all of the antigon-binding proteins produced are assembled in the desired configuration. (1) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute the Fc region (e.g., CH2 and CH3 for an IgG molecule) of a natural antibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. This sequence represents a heavy chain variable domain (VH) incorporated into Fv, an engineered protein containing a heavy chain variable domain and a light chain variable domain in one polypeptide chain, described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antigen-binding protein; single chain variable fragment; scFv; antigen; exfostatic; angiogenesis inhibitor; tumour; leukaemia; antibody; vascular endothelial growth factor receptor; VEGF; cell proliferation inhibitor.
migration of human leukaemia cells; blocking interaction of a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                               The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) (Ight chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEEF) receptor; reducing tumour growth; inhibiting angiogenesis.

CC (VEEF) receptor; reducing tumour growth; inhibiting wEGF induced migration of human leukaemia cells; blocking interaction of a protein and its light, promoting interactions between immune calls and target cells; and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins production so that substantially all of the antigen-binding proteins produced are assembled in the desired configuration. (I) is bivalent and bispecific, homogeneous and in tetrament for provide other antibody functions can be present. There is no regularement for processing in vitro to obtain the complete product. This is the amino acid sequence of a single chain variable fragment (sefv), an engineered protein containing a variable light and variable heavy chain on one polypeptide, described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vascular endothelial growth factor receptor; VEGFR; antagonist; tumour; cytostatic; heavy chain; myelocytic leukaemia; lymphocytic; erythrocytic; multiple myeloma; lymphoid cell; Hodgkin's disease; chimeric; human, picll vector.
                                                    New bispecific immunoglobulin-like antigen-binding protein for reducing
                                                                 tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 QVÄLQQSGAELVGSGASVKLSCTTSGFNIKDFYMHWVKQRPEQGLEWIGWIDPENGDSDY 60

The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGER) in mammals particularly humans. The method involves treating the mammals with humanised VEGER monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse variable region joined to human constant region, where the humanised mouse variable region contains mouse complementarly determining region (CDR) grafted into human variable region. The method is useful for treating leukaemias acute or chronic myelocytic leukaemia, acute or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to non-Hodgkin's and Hodgkin's disease. The present sequence is chimeric plc11 heavy chain fragment which is used for the construction of chimeric plc11 igg expression vector. Chimeric plc11 heavy chain contains cloned to the contains contains contains the constant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                   coligomerisation domain deleted and replaced by a leucine zipper coligomerisation domain deleted and replaced by a leucine zipper domain. The mutants preferably also have at least part of the p53 transactivation domain (amino acids 1-74) deleted and replaced by the transactivation domain (TD) from herpes simplex virus viral protein vp16 (amino acids 411-490) or by a protein domain able to bind selectively to a transactivation, especially a single-chain and acids variable domain (ScPv). The present sequence is that of a specifically claimed p53 variant designated S-325 and comprising a ScPv domain, amino acids 75-325 of human wild-type p53 and a secretive and more stable tumour suppressors and apoptosis-inducing agence than wild-type p53 and are active where the wild-type protein case is not, i.e. they are not inactivated by dominant negative or oncogenic mutants, nor by other cellular proteins (because the leucine zipper commain prevents formation of inactive mixed oligomers).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ij

```
coligomerisation domain deleted and replaced by a leucine zipper domain. The mutants preferably also have at least part of the p53 transactivation domain (amino acids 1-74) deleted and replaced by transactivation domain (amino acids 1-74) from herpes simplex virus viral protein VP16 (amino acids 411-490) or by a protein domain able to bind selectively to a transactivator, especially a single-chain can ibody variable domain (ScFv). The present sequence is that of a specifically claimed p53 variant designated S-35H and comprising a ScFv domain, amino acids 75-325 of human wild-type p53 (but with a replaced by His) and a leucine zipper domain at the C-terminal. The p53 variants are more active and more stable tumour suppressors and apoptosis-inducing agents than wild-type p53 and are active where the wild-type protein is not, i.e. they are not inactivated by dominant negative or oncogenic mutants, nor by other cellular proteins (because
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 QVKLQQSGAELVGSGASVKLSCTTSGFNIKDFYMHWVKQRPEQGLEWIGWIDPENGDSDY 60

The present sequence represents a single chain antibody (ScFv) designated 421. The antibody binds to an epitope present in the C-terminal region of the p53 protein that includes oligomerisation and regulatory domains, specifically between positions 320 and 393. ScFv 421 is directed against p53 mutants, particularly H273, W248 and G281 mutants. When the ScFv is introduced into cells containing a mutant p53 protein, p53 dependent trans-activating activity is restored. ScFv 421 is specific for p53-mutants that have lost tunnour-suppressing activity and are present in tumnour cells. It is particularly used to treat hyper-proliferation be used in vitro for studying mechanisms of activity of p53 or its mutant and to purify or detect p53.
                                                                                                                                                                                        Single chain antibody; ScFv 421; mouse; p53 protein; oligomerisation; regulatory domain; p53 mutant; H273; W248; G281; p53-dependent trans-activating activity; restoration; tumour-suppressing activity; tumour cell; reatment; hyper-proliferation; cancer; re-stenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 QVKLQQSGAELVGSGASVKLSCTTSGFNIKDFYMHWVKQRPEQGLEWIGWIDPENGDSDY 60

The present sequence is a heavy chain variable region of monoclonal antibody PAb-421 which is specific to the C-terminal DNA-binding domain of murine p53 protein. PAb-421 antibody and peptides based on complementatity determining regions of light and heavy chain variable regions of the antibody, are examples of active compounds useful in the diagnosis, prevention and treatment of SLE in humans.

Sequence

σ

```
The present sequence represents the heavy chain variable region for monoclonal antibody (MAb) 14G11, which immunoreacts with a lead cation. The sequence was derived from RNA isolated from mouse hybridona cells. The protein can be used for binding heavy metals, such as lead cations. It can be used for detecting, removing, adding or neutralising the heavy metals in biological and inanimate systems. It can be used in e.g. aqueous liquid systems, in biological or environmental systems or in such compositions as perfames, cosmetics, pharmaceuticals, health care products, skin treatment products, pesticides, herbicides, solvents used in the production of semi-conductor and integrated circuit components and production materials for electronic components. The products can provide for applications involving minute amounts of specific heavy metals.
                                                                                                                        Monoclonal antibody; Fd fragment; lead cation; perfume; cosmetic; pharmaceutical; health care; skin treatment; pesticide; herbicide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding heavy metal binding polypeptide sequences - used for detecting, removing, adding or neutralising heavy metals, such as

                                                                                                               The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGFR) in mammals particularly humans. The method involves greating the mammals with humanised VEGFR monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse variable fegion joined to human constant region, where the humanised mouse variable region contains mouse complementarily determining region (CDR) grafted into human variable region. The method is useful for treating jeukaemias such as acute or chronic myelocytic leukaemia, acute or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple jelomas and lymphoid cells, particularly those related to non-Rodgkin's and Hodgkin's alsease. The present sequence is humanised antibody light chain fragment used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting anglogenesis, comprises a complex of two polypeptides and two second polypeptides

arte standy associated in an immunogious in the complex. Fi mas an antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting vegenesis; creducing endothelial coll proliferation; inhibiting veger induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitor for investigative, diagnostic or treatment methods. The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in tetrameric form. The heavy chain constant domains which constitute the Fc region (e.g., CH2 and CH3 for an IgG molecule) of a natural continuement for provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. This sequence represents a light chain variable domain (VH) incorporated incorporated function of the invention.

The method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. P1 has an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 DIELTQSPAIMSASPGEKVTITCSASSSVSYMHWFQQKPGTSPKLWIYSTSNLASGVPAR 60

                                                                                                                                                                                                                                                                                                                                                                      ö
                                                       Novel immunoglobulin molecules binding kinase insert domain-containing receptor with the same affinity as vascular endothelial growth factor,
                                                                                                                                     Again in containing receptor (KDR) with a comparable affinity to human vascular endothelial growth factor (VEGF). The antibodies neutralise KDR activation. The immunoglobulin may be a multivatent single chain antibody, a monovatent single chain antibody, a diabody, a triabody, a humanised antibody or a chimerised antibody, a diabody, a triabody a humanised antibody or a chimerised antibody. The immunoglobulin molecules bind specifically to an extracellular domain of the KDR receptor with the same affinity as VEGF. Overexpression of VEGF has been implicated in a number of human tumour cell lines including giloblastoma multiforme, associated Karposi's sarcoma. The antibodies therefore have
                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present sequence is that of the light chain variable region of IMC-1C11, a mouse-human chimeric antibody that has vascular endothelial growth factor (VECF) antagonist activity. The antibody, or a fragment of it, can be used as an anti-angiogenic molecule, together with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an anti-angiogenic molecule and a chemotherapeutic agent, to produce a regression or arrest of the condition while minimising or preventing significant toxicity of the chemotherapeutic agent.

The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-1C11. Conditions that can be treated include a neoplasm, a collagen-vascular disease or an autoimmune disease, especially a solid tumour, including breast carcinoma, lung services and action of a specially a solid tumour, including breast carcinoma.

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) in the fail constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutraliging the activation of a vascular endothelial growth factor (VECF) receptor; reducing tumour growth; inhibiting vEGF induced migration of human leutance cells; blocking interaction of a protein and its lighton promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment comethods. The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in the desired configuration. (I) is bivalent and bispecific, homogeneous and in tetrament form. The heavy chain constant domains which constitute the region (e.g., CR2 and CR3 for an IgG molecules) of a natural cantibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. This sequence represents a light chain variable domain (VH) incorporated into the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                 New bispečific immunoglobulin-like antigen-binding protein for reducing tumour gröwth and for inhibiting angiogenesis, comprises a complex of two polypěptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 DİELIQSPAIMSASPGEKVTITCSASSSVSYMHWFQQKPGTSPKLMIYSTSNLASGVPAR 60

The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vaccular endothelial growth factor receptor (VESFR) in mammals particularly humans. The method involves treating the mammals with humanised VESFR monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse variable region joined to human constant region, where the humanised mouse variable region contains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, acute or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiphe myelomas and lymphoid cells, particularly those related to non-Hodgkin's and Hodgkin's disease. The present sequence is chimeric picil light chain fragment which is used for the construction of chimeric picil light chain (VL) and human kappa light chain contains cloned ö 1 DIELTQSPAIMSASPGEKVTITCSASSSVSYMHWFQQKPGTSPKLWIYSTSNLASGVPAR 60 20 DIELTQSPAIMSASPGEKVTITCSASSSVSYMHWFQQKPGTSPKLWIYSTSNLASGVPAR 79 ; Length 125; Indels 100.0%; Score 549; DB 22; 100.0%; Pred. The present sequence is that of the light chain variable region of IMC-1C11, a mouse-human chimeric antibody that has vascular endothelial growth factor (VEGF) antagonist activity. The antibody, or a fragment of it, can be used as an anti-angiogenic molecule, together with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an anti-angiogenic molecule and a chemotherapeutic agent, to produce a crarest of the condition while minimising or preventing significant toxicity of the chemotherapeutic agent.

The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes an antigen-binding process (12) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) is useful for: Ight chain constant domain (CL domain), and P2 has an antigen-binding cle site located to the N terminus of the CH1 domain. (I) is useful for: CC will be activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting anglogenesis; reducing endothelial cell proliferation; inhibiting vEGF induced in sugration of human leukaemia cells; blocking interaction of a protein and its ligand, promoting interactions between immune cells and target cells; and in vivo for investigative, diagnostic or treatment its ligand, promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment substantially all of the antigen-binding produced are assembled in the design of (I) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in the design of (I) provide other antibody functions can be present. There the Fc region (e.g., CH2 and CH3 for an IgG molecule) of a natural antibody and which provide other antibody functions can be present. There is the amino acid sequence of a single chain variable fragment (sefv), an engineered protein containing a variable light and variable heavy domain one polypeptide, described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antigen, binding protein; single chain variable fragment; scFv; antigen; cytostéptic, angigenesis inhibitor; tumour; leukaemia; antibody; vasculár endothelial growth factor receptor; VEGF; cell přoliferation inhibitor.

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) (Ight chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting angiogenesis, reducing endothelial cell proliferation; inhibiting VEGF induced (Is Igand; promoting interactions between immune cells and target cells; and in vivo and in viro for investigative, diagnostic or treatment can in vivo and in viro for investigative, diagnostic or treatment constantially all of the antigen-binding proteins production so that substantially all of the antigen-binding proteins production so that csubstantially all of the antigen-binding proteins production so that the desired configuration. (I) is bivalent and bispecific, homogeneous of in the desired configuration. (I) is bivalent and bispecific, nonstitute the FC region (e.g., CH2 and CH3 for an IgG molecule) of a natural contained which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain variable fragment configuration containing a variable light and variable heavy chain on ne polypeptide, described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      celi-targéting vector; antiviral; cytostatic; immunostimulant; AIDS; gene therapy; immunization; diagnosis; T cell-associated disease; SCID;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                  DNA sequence (1) encoding a single-chain variable antibody fragment (scrv). The products of the invention have antiviral, cytostatic and immunostimulant activity and can be used in gene therapy, immunization and diagnosis particularly of real-associated diseases, specifically acquired immune deficiency syndrome (AIDS), severe combined immune deficiency syndrome (AIDS), severe combined immune of the CDA receptor, with high selectivity, 4-5 fold selectivity over human B cells, and 1000 fold selectivity, ver other human cells. A vector fragment, fully defined in the specification. It was used to transform but costeograrcoma cells susceptible to spleen necrosis virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (SNV) cells, C0166 (human T lymphocyte) cells, and HeLa (human cervical carcinoma) cells. After 48 hours, the cells were stained with X-gal to determine transformation. The viral titer (infectious units/ml) was over 1 million for D17, 1 million for C0166 but less than 100 for HeLa, showing the high selectivity for human T cells. This sequence represents the SNV-env leader/human 7B2-scFv fusion construct used in the construction of novel cell targeting vectors described in the invention.
acquired immune deficiency syndrome; severe combined immune deficiency;
                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel cell-targeting vector (A) containing

They may also be used in a pharmaceutical composition for the therapy of e.g. melanomas, gliomas and carcinomas. The antibodies and fragments are derived from mice but are humanised so as to cause minimum reaction against them. They are produced
